IELTS Up Words!

Lesson 63: Genetic Engineering

Hello, and welcome to lesson sixty-three of IELTS Up Words by Lingemy.com. In the previous lesson, I talked about something that was related to the subject of technology. Do you remember what it was? It was the Internet of Things. IoT already exists in our lives in products such as smart mobiles, watches, and fire alarms, but it is not as invasive yet.

It is predicted that our future will be digital. It will be a tech-saturated world and us, humans, will probably be enslaved by our devices. We will be mired in problems caused by things such as scams and viruses more than ever before.

I have talked about this addiction before. The advent of wireless technology meant more portable devices, which has already led to a tech-driven life. However, I believe these problems will only intensify in the upcoming decades. Additionally, technological advances will serve to overhaul more industries at a lightning-fast pace and make fundamental shifts in many fields, such as genetics. I think we will soon see many breakthroughs that will revolutionize genetic engineering.

Genetic engineering is the artificial manipulation and modification of DNA, which has many applications, such as in medicine and agriculture. Scientists use it to create genetically-modified organisms, AKA GMOs, to enhance the quality of our lives. Corn, potatoes, and soybeans can be examples of GMOs, that are actually living organisms whose genetic material has been artificially manipulated in a laboratory through genetic engineering.

Another related subject is human cloning, which refers to producing a genetic copy of an existing person, which can have many implications. Researchers have observed some adverse health effects in sheep and other mammals that have been cloned. These

include an increase in birth size and a variety of defects in vital organs, such as the liver, brain, and heart. Other consequences include premature aging and problems with the immune system.

Overall, although the negative impacts that technology has brought with it are inevitable, I still think we can harness it to make positive changes in our life and planet so that the benefits outweigh the drawbacks.

What do you think about the matters that I discussed?

Speaking Tip

The Art of Exaggeration

One of the best ways to improve your pronunciation is to imitate the way native speakers talk.

When watching a film, pause after each dialogue and do your best to mimic the way the character speaks.

Exaggerate wildly at first, and then, little by little see how your pronunciation improves.

Exaggerating difficult sounds can be an effective method for improving English pronunciation, particularly during the early stages of learning.

Eventually, you will need to stop exaggerating, as it may seem awkward.
